```

Step 4. Open a new Python file and start coding

```
from flask import Flask
app = Flask(__name__)
@app.route('/')
def hello():
    return "Hello World"
if __name__ == '__main__':
    app.run(debug=True)
```

Step 5. Run the Python file using command `python filename.py`A screenshot of a Windows terminal window with a black background and red text. The terminal shows the output of running a Flask application. It starts with 'Serving Flask app 'app'', followed by 'Debug mode: on'. A warning message states: 'WARNING: This is a development server. Do not use it in a production deployment. Use a production WSGI server instead.' The server is running on 'http://127.0.0.1:5000'. Instructions to 'press CTRL+C to quit' and 'Restarting with stat' are shown. The debugger is active with PIN '858-048-661'. Two GET requests are logged: one for '/' returning 200, and another for '/favicon.ico' returning 404. The Windows taskbar is visible at the bottom with a weather widget showing 82°F and the date 29-10-2022.

```
